100. The influence of rotating masses and the weight of loom parts on the power consumption of overpick looms with inside reeding motion -- I. ILLES. *Stalovye Tekstil'mashiny* -- 1955, No. 4, pp. 148-151, 6 figs.

The weight of the slay and the role of the type of loom drive has been analyzed in connection with the irregularity of loom motion and power consumption. The power was measured by means of a three-phase, two-meter method whereas for measuring irregularity a commutator with 29 bars was used. The results are illustrated by graphs. The possibilities for reducing loom motion irregularities by applying a gear drive with clutch and by different rotating masses has been examined. Experimental data are furnished in respect to the distribution of the weight of the slay. In order to analyze the influence of the rotating masses the input of the loom-driving motor, its average losses, mechanical power requirements of the loom and efficiency of the motor after disengaging various parts of the loom were measured. The asymmetric distribution of the brake disc weight has an advantageous influence on the power consumption of the loom. By using adequate slay weights and rotating masses the irregularity of loom motion can be reduced from 38% to 22%.

2155. (411) ILLÉS T. 1. Chir. Univ. Klin., Pécs. •Die Behandlung der Knochenbrüche mit perkutaner kortikaler Fixation. I. Teil. Fixation der geknickten spiralen und schrägen Brüche der langen Knochen. The treatment of bone fractures with percutaneous cortical fixation. I. Fixation of closed spiral and oblique fractures of long bones ZBL.CHIR. 1956, 81/26 (1089-1096) Illus. 6

A new method of fixation of oblique and spiral bone fractures is described. Fixation is done with special nails, which are applied percutaneously, and penetrate superficially into the cortical bone, in order not to damage the bone. For the nailing, a compression apparatus supplied with a guiding needle is used. The precise adaptation and fixation of the fragments reduces the period of clinical recovery. Fixation of the neighbouring joint can usually be avoided, and in this way, better functional results can be obtained. The developing layer of callus is thin, and consequently stronger, and does not impair function. The time of hospitalization is minimal, viz. a few days.

 TITLE : Continuous Gas-Chromatograph (Hypersorption) Process for the Extraction of Propane and Butane from Natural Gas on a Semicommercial Scale  
 ORIG. PUB. : Banyasz Lapok, 13, No 2-3, 156-173 (1958)  
 ABSTRACT : A hypersorption process for the extraction of C<sub>3</sub>-C<sub>4</sub> from natural gas after removal of gasoline fractions in an adsorption column of 2.6 m height and 25 cm diam packed with activated charcoal is described. In addition to a detailed description of the assembly of the pilot plant unit, design data are presented for a hypersorption plant for the processing of 100,000 m<sup>3</sup> of dry gas per day.

47. Determination of the number of vaults respectively the lead value of arch constructions and the principles of assembling — *Исследование принципов, методов и конструкций сводчатых сооружений и сводчатых арок* — by J. Illesy, *Scientific Review of Civil Engineering — Aktye inzhenernoy Semele* — Vol. 1, No. 3, pp. 382-389, May 1951, 8 figs.)

In connection with designing steel structures it is decisive to know in what form the structural parts should be produced, respectively assembled in order to assume, after completion and under load, the shape for which the calculation was established. For this purpose it must be established which force system — due to a given load  $p_g$  — acts on the various structural parts. Then, presuming that the structural parts are cut off, it can be determined what unstrained shape each part will assume after the effect of the force system  $p_g$  has ceased. The shape thus produced will be the initial form, and manufacturing lead values are composed from the occurring displacements. Applying this principle to practice, thorough investigations are conducted on two and three-hinged arches, tensioned bar arches, the *Lange* girder as well as their production shape and total displacements. As a consequence of these investigations, the most adequate system for assembling all types of girders is given.

57. Determination of the camber of vault respectively the load value of ar constructions and the principles of assembling - Ivankovskiy (Ivankovskiy), V. I. (1961). *Prilozheniya k spetsial'nomu kursu po razrabotke i stroeniyu stальных konstruktsiy*. Moscow: Stroyizdat, 1961, 84 figs.

In connection with designing steel structures it is decisive to know: what form the structural parts should be produced, respectively assembled, in order to assume, after completion and under load, the shape for which the calculation was established. For this purpose it must be established which force system corresponds to a given load  $P_0$  -- acts on the various structural parts. Then, presuming that the structural parts are cut off, it can be determined what undeformed shape each part will assume after the effect of the force system  $P_0$  has ceased. The shape thus produced will be the initial form, and manufacturing load values are considered from the occurring displacements. Applying this principle to practice, research investigations are conducted on two and three-hinged arches, continuous beams, the beam girder as well as their production and initial displacements. As a consequence of these investigations, the most adequate system for assembling all types of girders is given.

New physiologically active ethers of cocaine J. [Ug and S. Boudischi (Jagellonian Univ., Kraków, Poland). *Kwartalski Chem.* 23, 410-23 (1940) (English summary). Mol. systems contg. ethylenoamine groups, known to possess antihistaminic properties, were studied. The following new amine ethers were synthesized: benzyl 2-benzylaminoethyl (I), bp 165-7°, benzyl 2-(benzylamino)ethyl (II), b, 113°, benzyl 2-dimethylaminoethyl (III), b, 131-3°, benzyl 2-diethylaminoethyl (IV), bp 134-7°, benzyl 2-aminomethyl (V), bp 105-13°, and benzyl 2-diethylaminoethyl (VI), bp 110-3°. They were prepared by condensation of Na deriva. of cocaine or its N-ethyl deriva. with Ph

CH<sub>2</sub>Cl or PhCH<sub>2</sub>Cl. All these compds. are only light yellow liquids, and have an aromatic odor. They were identified by their picrates, all cryst. from alc. as yellow prisms, melting as follows: I, 102.5-3.5°; II, 120-40.5°; III, 170-1°; IV, 113.5-14.5°; V, 200-0° (decomp.); VI, 141.5-2.5°. In clinical value III is equal to benadryl. R. A. A.

TITLE: Integral representation of a class of power series

SOURCE: Bulgarska akademiya na naukito. Doklady, v. 18, no. 1, 1965, 7-9

TOPIC TAGS: integral function, polynomial

ABSTRACT: [German article] Let  $T_1$  denote the class of integral functions comprizing the polynomials with nonpositive zeros or the limits of such polynomials; let in the similar manner  $T_2$  denote the class of integral functions comprizing the polynomials with real zeros or the limits of such polynomials. Here  $T_1 \subset T_2$ . In addition, let  $f_1(z) \in T_1$

$$f_1(z) = a_0 + \frac{a_1}{1!}z + \frac{a_2}{2!}z^2 + \dots \quad (1)$$

and  $f_2(z) \in T_2$ ,

$$f_2(z) = b_0 + \frac{b_1}{1!}z + \frac{b_2}{2!}z^2 + \dots \quad (2)$$

Card 1/2

ACC NR: AP5028414

One can construct

$$F(x) = f_1(x_1, x_2) / f_2(x_1, x_2) = \sum_{n=0}^{\infty} R_n(x_1, x_2) \frac{x_1^n}{n!}, \quad (3)$$

where

$$R_n(x_1, x_2) = \sum_{k=0}^n \binom{n}{k} a_{n-k} \beta_k x_1^{n-k} x_2^k \text{ ist.} \quad (4)$$

The author discussed in an earlier article (Compt. rend. Acad. bulg. Sci., 17, 1964, no. 9, 693) certain properties of the  $R_n$  polynomials and classified them (depending on the properties of the  $f$ 's) into Laguerre, Hermite, or Chebyshev type polynomials. The author presents in this communication an integral representation of certain subgroups of these polynomial series. The paper was presented by Kh. Khristov, Academician, 11 Sep 64. Orig. art. has 18 formulas. [JPRS]
